Linux Environment variable

1.State the command for the following.
a. view current environment variables
 printen v
b. display the PATH environment Variable value
echo $PATH
c. update PATH to include the path to your home directory
export PATH=$HOME:$PATH

2. How will you make the environment changes applicable to all users? Which script is to be modified?
 sudo nano /etc/profile

3. I have installed an application named "myapp". After installation, if I invoke the application, it fails with error as "Command myapp not found". How will you fix this?
Add the location of application to the PATH
